Review for Language models -
group 7

Accessibility consideration

This file does not fully conform with all applicable guidelines for accessible digital documents

[OPEN ALTERNATIVE](#)

Based on your reading of the Case study description and this Task 1 submission, which specific areas of the Case study description should the group focus on elaborating in their revision, and why?

The functional units are clearly defined, but there is room to strengthen this section, particularly around the technical characteristics of the SLM and the justification for the chosen functional units.

The included and excluded stages are well identified, but the justification could be developed further. The case study asks you to distinguish between exclusions due to limited relevance and those made for simplification, which would add more depth to this section.

The scenarios are well structured, but the reasoning behind them would benefit from being connected to expected sustainability impacts, not just describing what parameters change.

You could maybe add one sentence that links the defined scenarios a bit more directly to the functional unit and what differences you expect between them.

Overall, I think this is a clear and well-structured submission. One aspect that could be elaborated is the explanation of what you are actually testing in the different scenarios so that it is easier to understand why this is interesting.

I think the motivation and background you have for this case study is well described and makes sense. What is lacking a bit is the use of citations and how they are written. I would have liked to have seen a reference list at the end of the document and the use of this in the text to cite the different claims.

This was very similar to our submission, so I don't think I have much to add :) Maybe references to some of the statements in the introduction.

Hi group 7, thanks for a nice well written task 1 hand-in!

I have a few points:

1. In system boundaries, you should make clear whether areas in the full LCA is excluded due to limited relevance and exclusions made for simplification.
2. You should illustrate the system boundaries by a chart or diagram
3. I know you have stated that you are operating in Denmark, but maybe you could elaborate more in detail on the Energy mix and why this complicates comparing models in general.

I hope this is usefull

Carlos Lucero

Clarify if hardware was excluded because it is irrelevant or just to simplify things.

Anna Christiansen

I personally don't think any part of the sections needed further elaboration- but maybe object of assessment could be looked at.

How could the group make the functional unit they have defined clearer and more quantitatively compelling?

The functional units could be strengthened by including key technical characteristics of the SLM such as total parameter count, along with a brief discussion of why these functional units were chosen over alternatives. Furthermore, for the inference phase in particular, 200 output tokens means very different things on a GPU versus a CPU, so tying the functional unit to these measurable quantities would make it much more precise and easier to build on in later tasks.

 Nicolas Léon Emmanuel Faynot

I think your functional unit for training and inference is clear and makes sense

 Kaja Hovinbøle
04-03-2026 10:02:55

One small improvement could be to specify the SLM you are using

 Magnus Evensen
16-04-2026 15:17:51

Your functional unit for the training phase lacks a measurable performance condition, like f. ex. the final training loss of the model checkpoint. Without this the FU cannot be used. Your inference FU has a measurable output but you don't state that you use a trained model checkpoint to generate the output.

Again, their functional units have a very similar structure to ours. So I have nothing to add here as well.

 Christian Jessen Byskov

Regarding the functional unit i have only one point to make it more quantitativly compelling:

1. You should consider stating the specific model size and the hardware you are using in training and inference. instead of just listing "cpu" and "consumer laptops", you could specify the exact hardware model being used to make the unit quantitatively precise and reproducible.

 Carlos Lucero
10-03-2026 12:29:03

Define the training unit by tokens to make it more quantitative.

 Anna Christiansen
06-03-2026 16:50:03

I would think the functional units should include some data stating size og dataset and so on.
